ABSTRACT

The Schiff base ligand (HL) has been prepared by the reaction of p-aminoacetophenone with salicylaldehyde. This ligand was used to prepare complexes of the type \([ML_2(H_2O)_2]\), (where \(M^{2+} = \text{Mn, Fe, Co, Ni and Cu}\)). The resulting product was found to be solid which have been characterized using FTIR and UV-VIS spectroscopy. Elemental analyses have been performed using atomic absorption technique; the magnetic susceptibility and the conductivity have also been measured.

Keywords: P-aminoacetophenone, salicylaldehyde, Schiff base Complexes.

تحضّر معقدات فلزية مشتقة من السلفيدين بارا - ايمينو اسثيوفينون

التخليص

تم تحضير ليكند (HL) لقاعدة شف من تفاعل من بارا - ايمينو اسثيوفينون مع السلفيديهايد . استخدم هذا الليكند لتحضير معقدات نوع [ML_2(H_2O)_2] حيث (M^{2+} = \text{Ni , Co , Fe , Mn , Mn , Co , Fe , Mn , Cu} و Cu) . كانت المعقدات المحضرة صلبة وتم تشخيصها باستعمال مطيافية الاشعة تحت الحمراء والاشعة الفوق البنفسجية/المرئية . تم تحليل العناصر باستخدام تقنية الاشعة الامتصاص الذري ، وتم كذلك قياس الحساسية المغناطيسية والتوصيلية الكهربائية.
INTRODUCTION

Schiff bases derived from the salicylaldehydes are well known as polydentate ligands [1,2]. These ligands have been playing an important part in the development of coordination chemistry as they easily form stable complexes with most transition metal ions [3]. The interaction of these donors ligands and metal ions give complexes of different geometries and these complexes are potentially biologically active [4]. Schiff base complexes of transition metals containing ligands with N,O- donors play an essential role in agricultural, pharmaceutical, industrial chemistry [5], antifungal, antibacterial, anticancer and catalytic activities [6-8].

The metal complexes of Schiff bases have also received much attention. These complexes play an important role not only in the development of coordination chemistry, but also in catalysis, enzymatic reactions, magnetism, and molecular architectures [9], and they exhibit interesting biological activities [10].

EXPERIMENTAL

Chemical and Instrumentals

Metal salts (Mn(CH₃COO)₂.4H₂O, FeCl₂.2H₂O, CoCl₂.6H₂O, NiCl₂.6H₂O and CuCl₂.2H₂O) were obtained from Fluka Company without further purity. Salicylaldehyde, ethanol, and methanol were from B.D.H. Company.

Physical Measurements and Analysis

Melting points were recorded by using of Gallenkamp M.F.B- 600 F Melting Point Apparatus. FTIR spectra were recorded as CsI discs, using FTIR-8400S Shimadzu in the range of 4000-200 cm⁻¹. Electronic spectra were obtained by using of UV- VIS-1650 PC Shimadzu spectrophotometer at wavelength (200-1100) nm at 25°C in 10⁻³ M in DMSO. Conductivity was measured by capacitor analyzer in DMSO solution 10⁻³ M at 25°C. Magnetic susceptibility measurements were obtained at 25°C by using of Balance magnetic susceptibility of Bruke Magnet B.M.6, England. The metal percent in the complexes were determined by using of Shimadzu 680cc-flame/Japan atomic absorption.

Preparation of the Schiff Base (L)

The Schiff base ligand was prepared by the condensation of the p-aminoacetophenone (1 mmol) with (0.9381ml) (1 mmol) salicylaldehyde in absolute ethanol 10 ml). The resulting mixture was then refluxed for 90 mints. The yellow precipitate formed was filtered and recrystallized from ethanol to give yellow needles [11].

Preparation of the Complexes.

Ethanolic solution of ligand L (1 mmole) was added to an aqueous solution of each the metal salts (1 mmole) (Mn(CH₃COO)₂.4H₂O, FeCl₂.2H₂O, CoCl₂.6H₂O, NiCl₂.6H₂O and CuCl₂.2H₂O). The reaction mixture was continuously stirred for 120 minutes. The required product was shortly precipitated at room temperature, filtered off and washed with 1 : 1 (ethanol : water), recrystallization from ethanol and dried at 70°C.
RESULTS AND DISCUSSION

The physical properties and data of the ligand (L) with their metal complexes are given in Table (1). The values of molar conductivity (\(\Lambda\)) in DMSO[12].

Magnetic Properties

The magnetic moment \(\mu_{\text{eff}}\) for the complexes of \(\text{Mn}^{2+}(d^5)\), \(\text{Fe}^{2+}(d^6)\) and \(\text{Co}^{2+}(d^7)\) were found to be 6.0 B.M, 5.2 B.M, 4.1 B.M, respectively, which within the expected spin-only values [13, 14]. The higher value of \(\mu_{\text{eff}}\) of the \(\text{Ni}^{2+}(d^8)\) complexes 3.1 B.M may be due to the orbital contribution [15]. Finally, the \(\mu_{\text{eff}}\) of the \(\text{Cu}^{2+}(d^9)\) complexes was found to be 1.8 B.M which lies within the expected value for one electron [13]. All the data are found in Table (2).

The Electronic Spectra

The spectrum of free ligand L shows a strong band at 288 nm which may be attributed to $\pi \rightarrow \pi^*$ and another at 30864, 28409, 26315 cm$^{-1}$ due to $n \rightarrow \pi^*$ [16].

The electronic spectra of Mn (II) complex shows a single band at 520 cm$^{-1}$, assigned to $\nu$M-O vibration. For a high spin $d^5$ ion, there is no d-d transitions and all such bands in the spectra of Mn (II) complex is of low intensity.

Most of bands are fairly broad, but those which resulted from charge transfer transitions are sharp. Such phenomenon was seen in the complex. A band of 38910 cm$^{-1}$ (257nm) is attributed to a charge transfer transition for $p_x$ of the phenolate oxygen to the partially filled $d_x$ orbital on Mn(II) ion and the band at 28571 cm$^{-1}$ (350nm) is due to $^6$A$_{1g} \rightarrow ^6$T$_{1g}(p)$ transition. The observed data confirmed the presence of an octahedral geometry [17]. The magnetic moment value of the complex displays the presence of a high spin complex; this means that Mn (II) ion has five unpaired electrons.

The electronic spectrum of Fe (II) complex shows a band at 19569 cm$^{-1}$ which belongs to $^2$T$_{2g} \rightarrow ^2$Eg transfer.

The electronic spectrum Co (II) complex shows two bands 14836 cm$^{-1}$ and 22222 cm$^{-1}$, assigned as $\nu_2$ and $\nu_3$ absorption bands respectively, which clearly indicate that the complex has coordination octahedral geometry.

The electronic spectrum Ni (II) complex shows two bands, 18018 cm$^{-1}$ and 25000 cm$^{-1}$, assigned as $\nu_2$ and $\nu_3$ absorption bands respectively, which clearly indicate that the complex has six coordination octahedral geometry.

The electronic spectrum Cu(II) complex shows only one broad band is observed at 20618 cm$^{-1}$ assigned to $^2$Eg $\rightarrow ^2$T$_{2g}$ transition which is in conformity with octahedral geometry [18].
Infrared Spectral Studies

Infrared Spectrum of Free Ligand

The characteristic vibrations and assignments of ligand L and their complexes as CsI disc are described in Table 3. The spectrum of ligand L exhibited weak bands at 3360 cm\(^{-1}\) and 3050 cm\(^{-1}\), this could be attributed to \(\nu\) (O-H) and \(\nu\) (C-H) aromatic respectively [19]. While the strong band at 1678 cm\(^{-1}\) which belongs to \(\nu\) (C=O) and the other strong bands belong to the \(\nu\) (C=N) and \(\nu\) (C=C) aromatic were found at 1620 cm\(^{-1}\) and 1460 cm\(^{-1}\) respectively [20, 21], Figure 1.

Infrared Spectra of Complexes

The infrared spectra of the prepared complexes exhibited \(\nu\) (C=N) in the range of 1640-1630 cm\(^{-1}\) which shows a shifting to the lower frequencies by 15-25 cm\(^{-1}\) in compared with ligand L, it is which indicated the coordination of ligand with metal ions through the nitrogen atoms in their structures. The appearing of band for \(\nu\) (OH) vibration in the spectra of complexes is indicating the coordination of water oxygen with metal ions. The spectra bands of complexes at 1680 cm\(^{-1}\) was characterized for the carbonyl group which did not suffer a shift. Thus, it is suggested that the oxygen atom of this group is not coordinated to the metal ion.

Metal - Ligand Bond

The infrared of prepared complexes have shown weak bands in the range of 520-530 cm\(^{-1}\) and 420-440 cm\(^{-1}\) which was attributed to the of \(\nu\) (M-O) and \(\nu\) (M-N) respectively.

CONCLUSIONS

Schiff base complexes with the general formula \([\text{ML}_2]_2\text{H}_2\text{O}\) where \((\text{M}^{2+} = \text{Mn}, \text{Fe}, \text{Co}, \text{Ni} \text{ and } \text{Cu}), \) \((\text{L} = \text{salicylidene P-amino acetophenone})\) were synthesized. The elemental analysis, magnetic susceptibility, molar conductivity, FTIR and UV-Visible electronic spectral observations and the configurations were performed to coordinate the Schiff base through the nitrogen and oxygen. From the obtained results, it can be concluded that the bonding of all metal ions \((\text{M (II)})\) into the ligand \((\text{L})\) leads to form an octahedral structure. The suggested structure of the prepared complexes as shown in Figure 2:

\[ \text{CH}_3\text{N}-\text{CH} \]

\[ \text{O} \]

\[ \text{OH} \]

Figure (1): Structure of ligand \((\text{L})\).
